## Exercise 3.1

(a) Let  $S\subseteq I$  be a frequent itemset. Then every non-empty subset  $S'\subseteq S$  must also be frequent.

Let  $D = \{T \mid T \subseteq I\}$  be the database of transactions and  $T \in D$  a transaction in it. Let  $S \subseteq T$  be an itemset of T and  $S' \subseteq S$  a subset of S. Then we have

$$\{T \in D \mid S' \subseteq T\} \stackrel{S' \subseteq S \subseteq T}{\supseteq} \{T \in D \mid S \subseteq T\}$$
 (1)

It follows:

$$support(S') \stackrel{def}{=} |\{T \in D \mid S' \subseteq T\}| \stackrel{(1)}{\geq} |\{T \in D \mid S \subseteq T\}| \stackrel{def}{=} support(S)$$

Thus:

$$support(S') \ge support(S)$$
 (2)

Since S is frequent:

$$support(S') \overset{(2)}{\geq} support(S) \overset{Sfrequent}{\geq} minFreq \rightarrow$$

$$\rightarrow support(S') \ge minFreq$$

We conclude that S' is frequent.

(b) Let  $S\subseteq I$  be an arbitrary itemset. Then  $support(S')\geq support(S)$  holds for any non-empty subset  $S'\subseteq S$ .

See (2) in the previous proof.
